5COSC023W - Tutorial 11 Exercises

The Weather App (cont'ed)

1. Finish <u>ALL</u> of the functionality of the weather application (**including questions 3 and 4 and the different Timezone question**) developed in the previous tutorial. You should work on your own or in pairs and if you get stuck you should ask your tutor.

2. Extend the weather application so that the main activity displays the current weather for 3 cities all at the same time. This should include the city name, the icon of the weather (clouds, sun, etc) underneath and the temperature below the icon.

   The 3 cities displayed should be the last 3 cities that the user searched for across application runs (not only in this run instance), therefore you should be using *SharedPreferences* to save the names of the last 3 cities that the user searched for.
